

Business KPI Analysis Dashboard

KPI:

Q1:

- Lowest absolute figures (Sales ~2M, Orders/PC ~47)
- Still **far above targets** (+48% to +56%)
- Sales and orders show a **clear downward daily trend**
- Quantity sold is **volatile**, dependent on spikes

Q2:

- Sales per PC are about 4M with strong overperformance.
- Orders/PC (~69) and Customers/PC (~68) are **high but controlled**.
- Quantity trend is **smoother than Q1**.
- Orders decline more slowly than Q1.

Q3:

- Sales are around 4M, similar to Q2.
- The number of orders and customers stops growing and stays flat sooner than expected.
- Quantity sold fluctuates without strong follow-through.
- The sales trend still slopes downward.

Q4:

- Sales jump to **13M**
- Quantity sold (7,019) and orders (1,255) **dominate all other quarters.**
- Still outperforming targets by ~30–47%.
- But the daily sales trend remains **consistently declining.**
- Orders flatten despite much higher volume.

Total Sales by Product Category:

- **Clothing, Furniture, Electronics, Toys** → all clustered at a **similar high level**.
- **Books** clearly underperform compared to other categories.
- Revenue is **well-balanced** across the top 4 categories.
- Books are a candidate for **bundling or cross-sell**, not standalone growth.

Total Orders by Product Category:

- Books have **fewer orders and lower sales**, which confirms weaker category economics.
- High-revenue categories are **not relying on volume alone**, suggesting higher AOV.
- Revenue differences are driven more by **order value**, not order count.

Customer Concentration (Top 100 Customers):

- Top customers purchase **~30–40 units each**

- Significant spread in **total sales per customer**
- A **small number of customers drive a disproportionate share of revenue**
- Same quantity does **not** equal same revenue → product mix matters

Risks:

- Over-reliance on high-value customers
- Losing a few top accounts would materially impact revenue

Strategic action:

- Top customers (VIP, contracts) must be protected.
- Analyze how top customers purchase and apply the same approach to mid-tier customers to increase their value.

Geographic Performance (Sales by City):

- Sales are **metro-driven**, not evenly distributed nationwide.
- Coastal + large population centers dominate.
- There is a need for expansion penetration around existing hubs (regional scaling).
- It should be tested whether success is or or sales-team / logistics-driven.

In conclusion:

- Top customers likely buy **high-value categories** (Furniture, Electronics).
- Books likely contribute little to top-customer revenue.
- Large cities likely skew toward electronics and furniture.
- Smaller cities may lean toward clothing and toys.

While overall sales performance is strong, revenue is concentrated in early quarters, with a clear drop-off in Q3 and Q4.
